

Our team offers livestock grazing services as a unique biological vegetation management solution. Using high stock densities of sheep protected by livestock guardian donkeys, we integrate livestock grazing with traditional vegetation management to produce a safe and ecologically regenerative system for managing utility-scale solar arrays.

SERVICES

- Grazing livestock management
- Site grazing assessments
- Forage seeding assessments and recommendations
- Site improvements for livestock
- Increased solar production from cooler air zone created under modules

Our team offers livestock services as a sustainable method of maintenance, reducing the heavy equipment needed onsite. Our ever-expanding livestock department allows our landscaping team to be more effective across a larger geographical foot print. We remain committed to creating a viable alternative to traditional vegetation abatement programs.

We are proud to provide a vegetation management solution that enables electricity to be generated on the same land where sheep are raised."

Founded in 2014, Carolina Solar Services is a Durham-based operations and maintenance company. Over the years, we have established our presence throughout the Southeast and in Oregon to service 800+MW of solar assets. We remain true to our values of safety, client-focus, learnedness and environmental stewardship. We believe that Every kWh Matters!
